

31 May 2021

Monthly Employment and Unemployment Estimates

April 2021

In April, the unemployment rate stood at 6.9% and the labour underutilisation rate at 12.9%

March 2021:

- The employed population has increased by 0.6% from the previous month and by 0.4% from three months before and decreased by 0.3% from the same month of 2020.
- The unemployed population has decreased by 3.0% from February 2021 and by 4.1% from December 2020, having increased by 4.9% from March 2020.
- The unemployment rate (concept of the International Labour Organization, ILO) stood at 6.6%, 0.2 percentage points (pp) less than in the previous month, 0.3 pp less than three months before and 0.3 pp more than in the same month of the previous year.
- The labour underutilisation rate was estimated at 12.9%, down 0.9 pp from the previous month, down 0.8 pp from three months before and up 0.2 pp from a year earlier.

April 2021:

- The employed population remained practically unchanged from the previous month and increased by 1.0% from three months before and by 1.2% from the same month of 2020.
- The unemployed population decreased by 4.9% from March 2021, by 1.0% from January 2021 and by 9.0% when compared to April 2020.
- The unemployment rate stood at 6.9%, up 0.3 pp from the previous month, the same value from three months before and up 0.5 pp from the same month of 2020.
- The labour underutilisation rate was estimated at 12.9%, remained unchanged from the previous month and decreased by 0.9 pp from January 2021 and by 0.8 pp from a year earlier.

Monthly Employment and Unemployment Estimates (16 to 74)								
Main indicators								
	Unit	Seasonally adjusted data

Note: (p) - Provisional estimates.

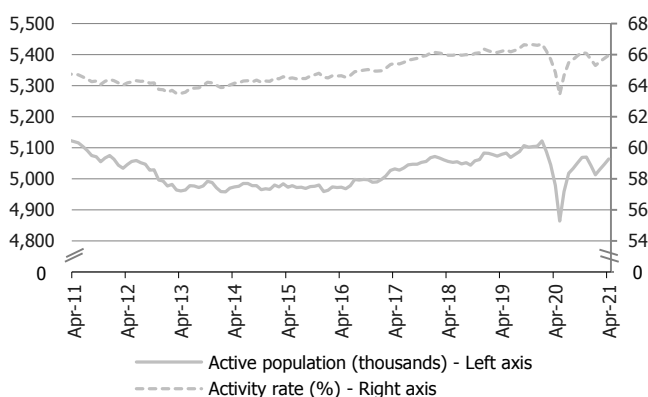

A. Active population and activity rate

In March 2021, the active population estimate stood at 5,047.1 thousand people, having increased by 16.5 thousand (0.3%) from the previous month, by 5.2 thousand (0.1%) from three months before and by 1.7 thousand from a year earlier (which corresponds to a nearly null relative change).

Similar behaviour had the activity rate, estimated at 65.8%: it increased by 0.3 percentage points (pp) from February 2021 and by 0.1 pp from both December and March 2020.

In April 2021², the active population stood at 5,063.9 thousand people, having decreased by 0.3% (16.8 thousand) from the month before, by 1.0% (50.4 thousand) from three months before and by 1.7% (85.1 thousand) from a year earlier.

Figure 1: Active population and activity rate
(seasonally adjusted data)

Note: All data series estimates are provisional.

Similar pattern was also observed in the activity rate (66.0% in April 2021): increased by 0.2% from March

² The estimates disclosed in this Press Release are all provisional. Beyond that, the estimates for the last reference month (in this case, the quarter centred in April 2021) were calculated with incomplete information for the last month of the quarter (May 2021). These estimates will be revised next month (as described in the technical note).

2021, by 0.7 pp both from January 2021 and by 1.1 pp from April 2020.

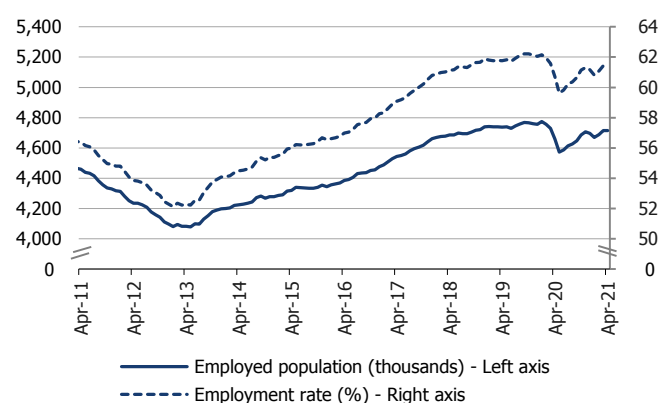

B. Employed population and employment rate

The employed population stood, in March 2021, at 4,714.7 thousand people, having increased by 0.6% (27.0 thousand) from the previous month and by 0.4% (19.4 thousand) from three months before and decreased by 0.3% (13.9 thousand) from a year earlier.

The employment rate stood at 61.4%, up 0.3 pp from the previous month, up 0.2 pp from three months before and down 0.2 pp from a year earlier.

In April 2021, the employed population, which stood at 4,715.2 thousand people, remained practically unchanged from the previous month, increased by 1.0% (46.9 thousand) from three months before and by 1.2% (56.2 thousand) from one year before.

Figure 2: Employed population and employment rate
(seasonally adjusted data)

Note: All data series estimates are provisional.

The employment rate was estimated at 61.4%, having remained unchanged from March 2021, up 0.6 pp from January 2021 and up 0.7 pp from a year earlier.

C. Unemployed population and unemployment rate

In March 2021, the unemployed population stood at 332.5 thousand people, having decreased by 3.0% (10.4 thousand) from February 2021 and by 4.1% (14.1 thousand) from December 2020 and increased by 4.9% (15.7 thousand) from March 2020.

The unemployment rate stood at 6.6%, having decreased by 0.2 pp from the previous month and by 0.3 pp from three months before, while having increased by 0.3 pp from a year earlier.

The youth unemployment rate stood at 22.2%, which corresponds to a decrease of 0.7 pp from the previous month. The adults' unemployment rate estimate was 5.5% and decreased by 0.3 pp from the month before.

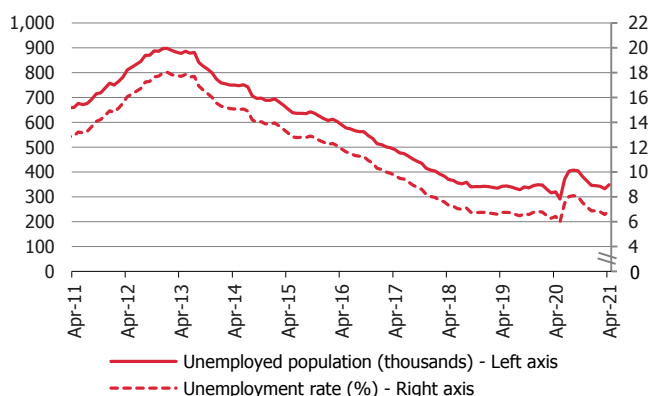

The youth unemployment rate (24.0%) increased by 1.8 pp from the previous month and the adults' unemployment rate (5.7%) has increased by 0.2 pp.

D. Inactive population and inactivity rate

In March 2021, the inactive population was estimated at 2,628.3 thousand people and it has decreased from the previous month (0.6%; 16.5 thousand), from three months before (0.3%; 6.7 thousand) and from the same month of 2020 (0.2%; 5.5 thousand).

That led to a similar pattern in the inactivity rate, which stood at 34.2%: down 0.3 pp from February 2021 and up 0.1 pp from both December and March of 2020.

Figure 3: Unemployed population and unemployment rate (seasonally adjusted data)

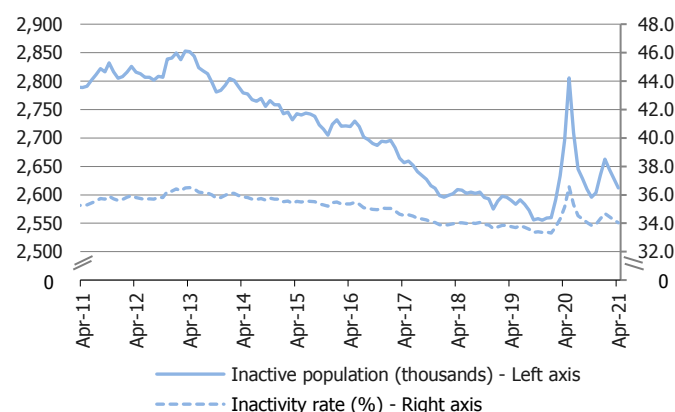

Note: All data series estimates are provisional.

In April 2021, the unemployed population – estimated at 348.7 thousand people – has increased by 4.9% (16.2 thousand) from the previous month, by 1.0% (3.5 thousand) from three months before and by 9.0% (28.9 thousand) from one year before.

The unemployment rate estimate was 6.9%, up 0.3 pp from the previous month and up 0.5 pp from April 2020, having remained unchanged from January 2021.

Figure 4: Inactive population and inactivity rate (seasonally adjusted data)

Note: All data series estimates are provisional.

In April 2021, the inactive population (2,614.4 thousand people) was lower than that of the previous month (0.6%; 15.9 thousand), than that of three months before (1.9%; 50.1 thousand) and that of the same month of the year before (3.1%; 83.6 thousand).

Therefore, the inactivity rate, estimated at 34.0%, decreased by 0.2 pp from March 2021, by 0.7 pp from three months before and by 1.1 pp from April 2020.

E. Supplementary indicators to unemployment and the labour underutilisation

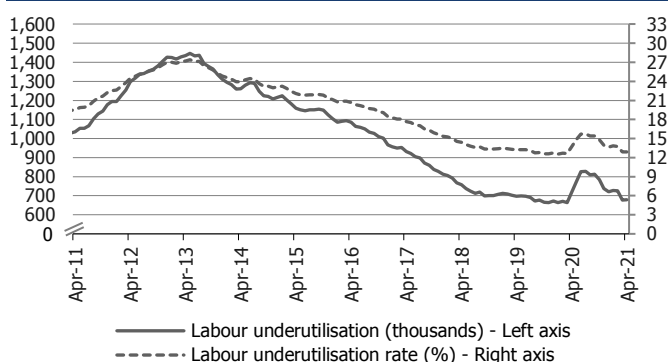

In March 2021, the labour underutilisation covered 678.0 thousand people, down from the previous month (6.6%; 47.6 thousand) and from three months before (5.8%; 42.1 thousand) but up from the same month of 2020 (2.0%; 13.5 thousand).

The labour underutilisation rate, estimated at 12.9%, decreased by 0.9 pp from the month before and by 0.8 pp from three months before and increased by 0.2 pp from March 2020.

In April 2021, the labour underutilisation stood at 679.4 thousand people, which corresponds to an increase of 0.2% (1.4 thousand) from March 2021 and to a decreased of 6.5% (47.4 thousand) from January 2021 and of 5.2% (37.6 thousand) from April 2020.

The labour underutilisation rate stood at 12.9%, having remained unchanged from the month before and decreasing by 0.9 pp from three months before and by 0.8 pp from the same month of 2020.

Figure 5: Labour underutilisation and labour underutilisation rate
(seasonally adjusted data)

Note: All data series estimates are provisional.

F. Active, employed, unemployed and inactive population

In summary, in March 2021, from the previous month, the active population has increased by 16.5 thousand, while the inactive population has decreased by 16.5 thousand³. The increase of the active population was due to the increase of the employed population (27.0 thousand) having more than compensated the decrease of the unemployed population (10.4 thousand). On the other hand, the inactive population decrease was mainly explained by the decrease in the number of inactive persons seeking but not available to work (12,5 thousand) and in the inactive persons available to work but not seeking a job (18,8 thousand).

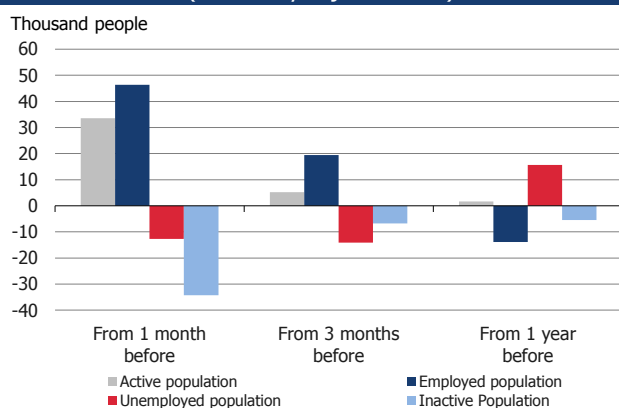

The increase of the active population (5.2 thousand) compared to three months before came from the increase of the employed population (19.4 thousand) having more than compensated the decrease of the unemployed population (14.1 thousand). In turn, the inactive population decrease of 6.7 thousand people was mainly due to the decrease in the number of inactive persons seeking but not available to work (10.6 thousand).

At last, the slight active population increase (1.7 thousand) from March 2020 was followed by the increase of the unemployed population (15.7 thousand) and by the decrease of the employed population (13.9 thousand). The inactive population has decreased by 5.5 thousand people, as a result of the decrease in the number of inactive persons who were not part of the labour underutilisation, this is, those who were not

³ The changes in the active population and in the inactive population are not necessarily symmetrical. They are also influenced by the total population change that results from the natural balance and the net migration.

available to work and did not seek a job
(15.0 thousand).

Notes: (p) - Provisional estimates.

Start, in January 2021, of a new Labour Force Survey data series

Following:

- The adoption of the Resolution concerning Statistics of Work, Employment and Labour underutilisation at the 19th International Conference of Labour Statisticians promoted by the International Labour Organization in 2013;
- The publication, in October 2019, of the Integrated European Social Statistics Regulation (IESS Framework), which aims at ensuring that social statistics based in sampling surveys and related to individuals and households are produced in a more coherent and coordinated manner at the European level ([Regulation \(EU\) 2019/1700 of the European Parliament and of the Council of 10 October 2019](#));
- The publication of a set of additional regulations, among which there is the Commission Implementing Regulation in the labour force domain ([Commission Implementing Regulation \(EU\) 2019/2240](#)).

In January 2021, the countries participating in the European Statistical System started, in a coordinated manner and in conjunction with Eurostat, the collection of a new Labour Force Survey (LFS) data series. Although this new series does not contain any fundamental change to the conceptual framework underlying the LFS, there are still some innovations. One of these changes was the reinforcement of the sample size to ensure compliance with more demanding precision criteria. Additionally, it is also worth mentioning:

- The change in the reference age of active population to “16 to 89 years old” (before it considered those aged 15 and over).
- In line with the ILO recommendations, people in agriculture and fisheries activities exclusively for self-consumption are no longer considered in the employed population.
- The update of the questionnaire, in particular the questions that determine the labour force status.
- The modularization of the questionnaire, which will include questions with different periodicities (quarterly, annual, biennial and every 8 years)

Among the characteristics that are preserved, are the sample and the quarterly rotation scheme (1/6 in each quarter). Therefore, 5/6 of the 1st quarter of 2021 sample as answered to the LFS in the 4th quarter of 2020.

Nonetheless, to assess the impact of data series change, Statistics Portugal carried out during the 1st quarter of 2021, in parallel with the main operation, a pilot survey using the questionnaire of the previous data series (LFS2011, in force between 1Q2011 and 4Q2020) and a smaller sample. As a result of this assessment, these two simultaneous statistical operations may determine additional adjustments, beside those related with the change of the reference age group of active population and the reclassification of those engaged in agriculture and fishing activities for self-consumption in order to obtain backward revised time series consistent with the new one.

TECHNICAL NOTE

Labour Force Survey

The main purpose of the Labour Force Survey is to characterise the population in terms of the labour market. It is a quarterly sample survey, addressed to families occupying the same dwelling in the national territory, which makes available quarterly and annual data.

Most of the characteristics observed in this survey report to the situation in one pre-defined week (from Monday to Sunday), known as reference week. The reference weeks are uniformly distributed throughout the quarters and years. The interviews usually take place in the week following the reference week.

The information is obtained directly, through computer-assisted interview, by using a mixed data collection mode: the initial interview is done face-to-face by an interviewer visiting the household and the other five interviews are done by telephone, if certain requirements are met.

Published data were calibrated by using the population estimates calculated from the final results of Census 2011.

Monthly Employment and Unemployment Estimates

In 2014, Statistics Portugal initiated a monthly release of Labour Force Survey estimates for the main labour market indicators in addition to the usual quarterly estimates releases.

With this initiative, Statistics Portugal intends to provide to users monthly updated information on labour market recent developments, allowing, at the same time, a more complete reading picture than that provided so far by Eurostat in its monthly releases of the unemployed population and unemployment rate estimates for Portugal. With this dissemination, Statistics Portugal satisfies also a specific requirement from the PEEIs (Principal European Economic Indicators).

Taking advantage of the continuous nature of the Labour Force Survey collection process, it is possible to monthly obtain estimates related to successive sets of three months (moving quarters), assuring consistency with the quarterly released estimates.

The monthly estimates refer to *centred* moving quarters, where the reference month (m) corresponds to the central month of each moving quarter. In fact, the reference month of each Press Release corresponds to the central month of the quarter composed by $m-1$, m and $m+1$ months. As a consequence, the monthly changes are calculated on values that contain common months. Therefore, the comparison of moving quarters without common months should be done in relation to reference months three months earlier.

The option for disseminating centred moving quarters series aimed at avoiding delays in the detection of turning points in the economic cycle that arise from the use of simple moving averages, but it implies that the estimates for the latest released moving quarter are provisional (see "Revisions" section below).

As estimates of centred moving quarters, the values (not seasonally adjusted) of the reference months February, May, August and November of each year correspond to the estimates of the 1st, 2nd, 3rd and 4th natural quarters, respectively, whose results are published and analysed with greater detail in the quarterly releases of the Labour Force Survey estimates.

The estimates for the last reference month are always provisional, as they correspond to a moving quarter where for the third month the data collection is not completed yet. In fact, for the first two months ($m-1$ and m) the data collection from the Labour Force Survey is already completed, while for the third month ($m+1$) only partially collected data are available.

In this context, in each monthly Press Release the provisional estimates for the reference month and the revised estimates for the previous months are published, due the availability of complete information for the last moving quarter.

Information available

The data series selected for monthly releases refer to both employed and unemployed population, by sex and age group, and to the corresponding rates. In relation to these data series, it should be noted the following:

- Unless otherwise stated, the data series analysed in this Press Release are seasonally adjusted. For this reason, the analysis focuses on the comparison with the most recent periods. As agreed, Eurostat started using these estimates in its unemployment monthly releases. The original data series (not seasonally adjusted; as in the Statistics Portugal quarterly releases), are available in Tables of the annex.
- The indicators analysed in this Press Release were calculated for the age subgroup of those aged 16 to 74 (as in the Eurostat News Release), which differs from the criterion adopted at the Statistics Portugal quarterly releases (people aged 16 to 89, in line with the concepts in force of the International Labour Organization).

The back series for all the released and analysed indicators in this Press Release, since February 1998 (quarter from January to March 1998), are available at the Statistics Portugal website.

Due to rounding, totals may not correspond exactly to the sum of the parts.

Revisions

The monthly released data are subject to regular revisions, as previously mentioned. The revisions come from obtaining the final estimates for the previous reference month (moving quarter) due to the conclusion of its last month collection process. In addition, the revisions also come from the updating of the seasonally adjusted data series whenever a new observation is added. Therefore, in each Press Release the not seasonally adjusted final estimates for the previous reference month are published.

In addition, with the start of the new Labour Force data series in January 2021, and until its impacts are known (see page 10), all monthly estimates from February 2011 onwards are provisional. Depending on the observed impact, these estimates may be revised again, after the release of the estimates for the 1st quarter of 2021.

Revision of March 2021 estimates (16 to 74) - main indicators -			
	Unit	Seasonally adjusted data	Not seasonally adjusted data
Active population		17.5	17.4
Employed population		13.7	13.4
Unemployed population	Thousands	3.9	4.1
Inactive population		- 17.5	- 17.5
Labour underutilisation		- 21.5	- 20.5
Employment rate		0.2	0.2
Unemployment rate		0.1	0.0
Men's unemployment rate		0.1	0.0
Women's unemployment rate	pp	0.1	0.1
Youth unemployment rate (16 to 24)		- 0.8	- 0.9
Adults' unemployment rate (25 to 74)		0.1	0.1
Labour underutilisation rate		- 0.4	- 0.4

Some concepts

Unemployed: person aged 16 and 74 who during the reference period met simultaneously the following conditions:

- neither had a job nor was at work;
- had actively sought work, i.e. had actively searched for a paid or unpaid job during the specified period (reference period or the three previous weeks); and
- was available for a paid or unpaid job.

Employed: person aged 16 to 89 who, during the reference period, was in one of the following situations:

- worked for at least one hour for a wage or salary, in cash or in kind (including unpaid family work);
- had a formal attachment to his/her job but was not at work temporarily;
- was in early retirement, but working in the reference week.

Working age resident population: Resident population aged 16 to 89.

Active: person aged 16 to 89 who, during the reference period, furnish the supply of labour force for the production of economic goods and services (was employed or unemployed).

Labour force: population formed by all active persons.

Extended labour force: corresponds to the labour force enlarged by the inactive seeking work but not immediately available and the inactive available but not seeking work.

Labour underutilisation: indicator that aggregates the unemployed population, the underemployment of part-time workers, the inactive seeking work but not immediately available, and the inactive available but not seeking work.

Unemployment rate: rate that defines the relation between the unemployed population and the labour force.

$$U.R. (\%) = (\text{Unemployed population} / \text{Labour force}) \times 100$$

Employment rate: rate that defines the relation between the employed population and the working age population.

$$E.R. (\%) = (\text{Employed population} / \text{Working age population}) \times 100$$

(continuation)

Extended labour force: corresponds to the labour force enlarged by the inactive seeking work but not immediately available and the inactive available but not seeking work.

Labour underutilisation: indicator that aggregates the unemployed population, the underemployment of part-time workers, the inactive seeking work but not immediately available, and the inactive available but not seeking work.

Unemployment rate: rate that defines the relation between the unemployed population and the labour force.

$$\text{U.R. (\%)} = (\text{Unemployed population} / \text{Labour force}) \times 100$$

Employment rate: rate that defines the relation between the employed population and the working age population.

$$\text{E.R. (\%)} = (\text{Employed population} / \text{Working age population}) \times 100$$

Activity rate of the working age population: rate that defines the relation between the labour force and the working age population.

$$\text{P.R. (\%)} = (\text{Labour force} / \text{Working age population}) \times 100$$

Inactivity rate of the working age population: rate that defines the relation between the working age inactive population and the working age population.

$$\text{P.R. (\%)} = (\text{Working age inactive population} / \text{Working age population}) \times 100$$

Labour underutilisation rate: rate that defines the relation between the labour underutilisation and the extended labour force.

$$\text{L.U.R. (\%)} = (\text{Labour underutilisation} / \text{Extended labour force}) \times 100$$

For the indicators selected for monthly dissemination, it was considered the age subgroup of those aged 16 to 74.

For a more detailed definition of the concepts and methodological features of this statistical operation, consult the [Labour Force Survey](#) or the [Monthly Employment and Unemployment Estimates](#) methodological documents (both only in Portuguese) available at the Statistics Portugal website.
