Quarterly National Accounts – Flash Estimate

1st Quarter 2013

Gross Domestic Product decreased 3.9% in real terms in the 1st quarter 2013

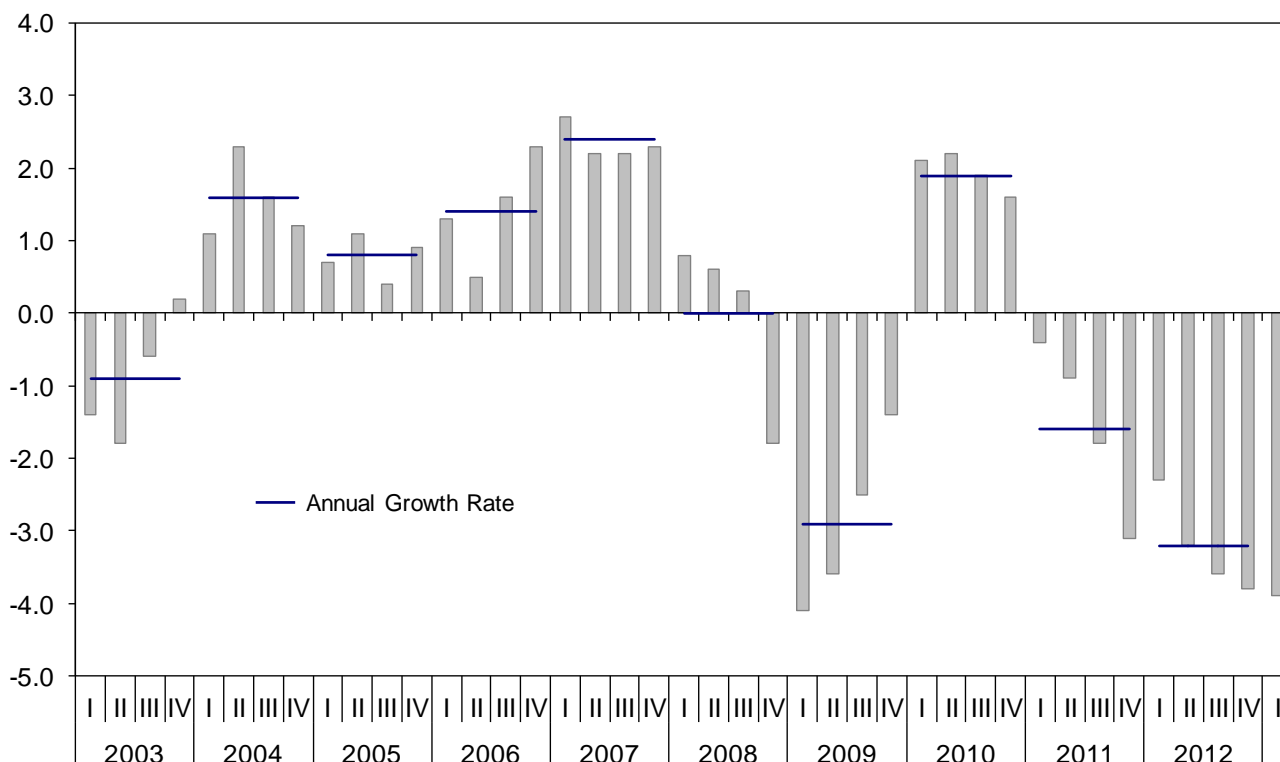

Accordingly with the flash estimate of the Quarterly National Accounts, the Portuguese Gross Domestic Product (GDP), registered a year-on-year change rate of -3.9% in volume in the 1st quarter 2013 (-3.8% in the previous quarter). Domestic demand presented a more negative contribution for the year-on-year change rate of GDP, determined by the more pronounced decline in Investment, particularly in Construction. In the opposite direction, the positive contribution of net external demand increased, mainly due to the more intense reduction of Imports of Goods and Services.

Comparing with the previous quarter, the Portuguese GDP diminished 0.3%.

1/3

This flash estimate includes revisions in the data, particularly the updated information on external trade of goods, with revisions in nominal terms since 2011 and in the deflators for the 4th quarter of 2012. This new information implied downward revisions in GDP change rates in the 2nd and 3rd quarters of 2012.

Next Press Release of Quarterly National Accounts

Current estimates of Quarterly National Accounts (detailed results) for the 1st quarter 2013 will be published in 5th June 2013.

Methodological information about the flash estimates

Flash estimates for GDP constitute the first synthetic indication on the quarterly behaviour for the Portuguese economy and do not replace the main estimates of Quarterly National Accounts (also designated as current estimates), more accurate and detailed, which are published 70 days after the end of the reference quarter.

These flash estimates are calculated using the same methodology, and preferably the same basic information, compared to the Quarterly National Accounts current estimate. The percentage of basic information available for flash estimates is over 80%. Methods for imputation and forecasting are used in those cases where basic information is not complete, selected after a series of tests performed over a large sample. One must take into consideration that these flash estimates are eventually subject to larger revisions (when compared to current estimates), although the percentage of basic information available is high.

In the real time tests carried out from 2nd quarter 2005 onwards, the mean absolute error for the flash estimate was 0.1 percentage points for both year-on-year quarterly change rate and quarter-on-quarter change rate, when compared to the current estimate. However, it must be stressed that in the current economic juncture, characterized by significant price decelerations or even reductions, the difficulty in measuring the behaviour of main macroeconomic aggregates is particularly high, mainly in splitting the nominal change of exports and imports in price and volume changes. It should be reminded that when this estimate is produced the usual information on external trade deflators used in the Quarterly National Accounts compilation is not available.

This press release only includes information on quarter-on-quarter and year-on-year quarterly change rates in real terms.

Change rates included in this press release are calculated from chain-linked volume data (2006=100). Data is seasonally adjusted.
