Quarterly National Accounts – Flash Estimate

2nd Quarter 2007

Gross domestic product up by 1.6% in real terms in the 2nd quarter 2007

Portuguese Gross Domestic Product (GDP) grew 1.6% in volume in the 2nd quarter 2007, comparing to the same quarter of the previous year, decelerating from the previous quarter (2.0%). The first estimate for the quarter-on-quarter change rate in the Portuguese GDP points to an increase of 0.4%, also in real terms.

Next Press Release of Quarterly National Accounts

Current estimates of Quarterly National Accounts (detailed results) for the 2nd quarter 2007 will be published 7th September 2007.

Methodological information about flash estimates

Flash estimates for GDP constitutes the first synthetic indication on the quarterly behaviour for the Portuguese economy and does not replace the main estimates of Quarterly National Accounts (also designated as current estimates), more accurate and detailed, which will be published 70 days after the reference quarter.

These flash estimates are calculated using the same methodology, and preferably the same basic information, that Quarterly National Accounts current estimate. The percentage of basic information available for flash estimates is over 80%. Methods for imputation and forecasting are used in those cases where basic information is not complete, selected after a series of tests performed over a large sample. One must take into consideration that these flash estimates are eventually subject to larger revisions (when compared to current estimates), although the percentage of basic information available is high.

This press release only includes information on quarter-on-quarter and year-on-year quarterly growth rates in real terms.

In the real time tests carried out from 2nd quarter 2005 onwards, the mean absolute error for the flash estimate was 0,2 percentage points when compared to the current estimate.

Growth rates included in this press release are calculated from chain linked volume data (2000=100). Data are seasonally adjusted.

The revisions implicit in these flash estimates are mainly the result of the integration of the data from Annual Definitive National Accounts for the year 2004.
