INSTITUTO NACIONAL DE ESTATÍSTICA
PORTUGAL

PREFACE

The Internet, computers, mobile phones, and other developments of information and communication technologies as optic fiber and digital TV, have deeply transformed the way people live – how they learn, work, use their free time and interact, both in personal relationships and with organizations.

The Information Society flowing from this transformation, where the organization in networks, the mobile communication and the globalization of interactions assume special roles simultaneously made possible by the information and communication technologies and enhancing their generalized usage, is among us already for several decades. It is no more a futuristic vision, but a reality with a substantial past and world expansion whose analysis and understanding should be sustained on concrete empirical data and rigorous sociological methodologies.

It is also clear the central importance of this transformation for current and future economic opportunities and for the quality of life of people – the future of societies is played on this table board – hence its practical relevance strengthens the need for its systematic characterization and monitoring.

The data for our country reveal major contrasts in the usage of information and communication technologies that bring us particular specificities within Europe. For example, regarding the adult population usage of computers and the Internet within EU25, Portugal has simultaneously one of the highest values for the population with secondary or higher education (only after the Nordic countries, Netherlands, Luxembourg and United Kingdom) and one of the lowest values for the population with less than secondary education, which is in Portugal a very high fraction of all the adults. This example shows that we have a special situation whose rapid evolution requires our own solutions.

PREFACE

The electronic publication “Information Society in Portugal 2006” is a compilation of data resulting from the continued collaboration of the several institutions involved in its preparation, themselves organized in a network, but of also others that were pioneers in the observation of this area, among which the former Observatory of the Sciences and Technologies deserves a special reference. Practically all these data where already available in the Internet, but assembling them facilitates the access to an integrated set of interest for understanding the Information Society situation and evolution in Portugal. We are aware that the work to be performed in this area must be further pursued, with the flexibility necessary in a period of quick changes, and must mobilize institutions and researchers for the analysis and understanding of the varied and complex transformations that are being felt in society, and to open new windows over the future.

Luis Magalhães
President
Knowledge Society Agency

PREFACE

The publication “Information Society in Portugal 2006” aims primarily to provide a structured set of information on the establishment and usage of the information and communication technologies and to allow a reflection on their contribution for the development of the Portuguese society under the framework of the Lisbon Strategy.

This publication is the result of a solid effort developed by a group of entities that, under the High Statistical Council, gathered their knowledge in order to create a data set that described, as accurate as possible, for each moment of observation, the Information Society conditions of development.

This institutional partnership created after the approval of the “Green Book on Information Society” and enhanced by the goals established on the Lisbon agenda decided by the European Council, was also improved by ongoing reflections from international institutions working in the area and by the statistical programmes defined by Eurostat.

In this context, INE Portugal was obviously an active partner on the supply of indicators, introducing the first surveys for the regular observation of the information and communication technologies usage by households and enterprises, in line with the comparability criteria defined under the framework of the European Union.

The result of the work developed by the different entities is presented in this publication, which includes information on the available infrastructures and their usage by households, enterprises and public administration.

PREFACE

The current national statistical production for the Information Society area is still focused on the description of the information and communication technologies usage, and less oriented to the evaluation of the related social, economical, technological and cultural changes. The evaluation of these ongoing transformations requires inevitably a broader time span and a new effort concerning the definition of measuring instruments.

This publication, in spite of not being yet an exhaustive and detailed characterization of the Information Society in Portugal, represents a remarkable example of inter-institutional articulation under the framework of the National Statistical System.

It is believed that with this joint effort it will be possible to meet the challenges the National Statistical System is facing in the Information Society field and to deepen this important statistical system for the present and forthcoming societies.

Alda de Caetano Carvalho
President of the Administration Board
National Statistical Institute

INTRODUCTION

The elaboration of a document objectively portraying the state of Information Society in Portugal, in both statistical appraisal and reference indicators, has been a long thought project in the Information and Knowledge Society Observatory (OSIC) of UMIC - Knowledge Society Agency.

We pursued a triple ambition. First, to “seize” a complex phenomenon of widely inaccurate contours, which penetrates several interstices of personal and social life, in its fundamental dimensions. Then, to “normalize” the corpus of data and information available in the different organizations that, in their own sphere of responsibility, observe the Information Society, thus avoiding statistical inconsistency entailing negative consequences namely in the external plan. Finally, to ascertain an effective follow up of the main changes occurring in what is, undoubtedly, one of the most dynamic and unstable segments of our collective life, through a regular publication, not excessively spaced in time.

After long months of reflection and discussion it was considered appropriate to entrust the task to the Information Society Statistics Monitoring Working Group (GTAESI), bearing in mind its fourth mandate endorsed by the High Council of Statistics in the context of the correspondent deliberation for its creation (nº 174), on 8th July 1999:

- a) The coordination, integration and methodological harmonization of statistical information collected by the different organizations, in the scope of Information Society, and eventually the presentation of proposals for new surveys;
- b) The conceptual and methodological reflection on the production of indicators for the Information Society;

INTRODUCTION

- c) The presentation of proposals for statistical indicators production which allow to express the levels of economic-social impact and of the Information Society penetration development in the Portuguese society; being, in order to achieve this purpose, necessary to revise and/or incorporate methodologies that stress the country specificities;
- d) The articulation with several representations of Portugal in international organizations, namely, OECD and EUROSTAT.

GTAESI is currently formed by representatives of the following organizations:

- UMIC - Knowledge Society Agency (through OSIC) - which chairs the Working Group;
- National Statistical Institute (INE);
- DGEEP -General Directorate of Study and Prevision;
- Institute of Informatics (II), of the Ministry of Finance and Public Administration;
- Observatory for Science and Higher Education (OCES), of the Ministry of Science, Technology and Higher Education;
- National Communications Authority (ANACOM);

INTRODUCTION

- Bureau for Information and Evaluation of the Education System (GIASE), of the Ministry of Education;
- Regional Statistical Office of Azores (SREA);
- Regional Directorate of Statistics of Madeira (DREM).

The Cabinet of the National Coordinator for the Lisbon Strategy and the Technological Plan (GCNELPT) and the Communication Observatory (OberCom) recently accepted the invitation to participate under an observer status.

After an intense and participative discussion between its members, GTAESI decided to accept the challenge, involving the organizations represented in it and aiming for the accomplishment of a dually innovative task (as expressed in the recommendations submitted to the High Council of Statistics): production of a “statistical yearbook” (to be started in 2006) which will allow to present the portrait of Information Society in Portugal; and the organisation of an annual seminar focused on communicating “what we know” and promoting the discussion about “what we do not know” in what concerns Information Society monitoring.

The publication, that is now made public, represents the product of that intense work.

Most of all, it is the result of an exemplary collaboration between public bodies, which managed to go beyond the fragmentation that usually reigns in the sphere of public information. The initiative also demonstrates a high level of maturity in a transversal cooperation within the public sphere of responsibility, with clear benefits for the wide - and ever increasing - community of Information Society statistics users.

INTRODUCTION

The “coherence” and “intelligence” added value of this publication, plus the “transparency” of submitting it to public scrutiny in the context of a seminar held exclusively for that purpose, marks a turning in the *modus faciendi* and in the communicational strategy of Information Society statistics and indicators in Portugal.

I am deeply thankful to all of those who contributed, within GTAESI and in the scope of the respective public bodies, for the creation of the climate of mutual trust and active collaboration that made possible this huge step forward. For the special coordination responsibilities undertaken in this well succeeded process I should like to single out, as a fair expression of recognition, the representatives of OSIC/UMIC and of INE, who were untiring in the execution of the complex responsibilities that have been trusted to them.

Many thanks to all!

Roberto Carneiro

METHODOLOGICAL NOTES

INTRODUCTION | TELECOMMUNICATIONS

In the last decades, the telecommunications sector has been playing a determinant role in the economic development, productivity growth and technological diffusion. In this chapter, of the responsibility of ANACOM, you will find statistical information on specific indicators that allow knowing the present state of the country's infrastructure, namely on the subject of Fixed Telephone Service, Cellular Mobile Service, Cable Networks and Internet Access Service.

The main findings are:

- The total number of main telephone accesses installed at customer request stands at 4,07 million, representing a penetration rate of approximately 39 accesses per 100 inhabitants;
- The number of direct access fixed telephone service customers is approximately 3 077 million;
- At the end of the 2nd trimester of 2006, there are approximately 483 thousand carrier pre-selection costumers and 77 thousand active customers using access via call-by-call selection;
- Regarding the Cellular Mobile Service, there are 11,74 million subscribers;
- The Cellular Mobile Service penetration rate is 111%;
- The cable television distribution service has over 1,4 million subscribers at the end of June 2006.
- Regarding the Cable TV distribution by Direct To Home (DTH) technology, there are about 383 thousand subscribers;
- About 28% of all Portuguese households have subscriptions to a cable television distribution service;

INTRODUCTION | TELECOMMUNICATIONS

- Some 36% of cabled households have a subscription to a cable television distribution service;
- The total number of Internet Access Service subscribers with fixed access is about 1,55 millions, of which 1,28 millions are residential customers;
- The broadband penetration rate with fixed access in Portugal is about 12,7% at the end of June 2006.

METHODOLOGICAL NOTES | TELECOMMUNICATIONS

Universe

The Fixed Telephone Service, Cellular Mobile Service, Cable Networks and Internet Access Service data was collected from authorized operators or service providers, on the terms of Law no 5/2004, of February 10th.

Periodicity of the information compilation

Quarterly. Data for the 4 services was compiled during the month after the end of the reference period.

Inquiry method

Questionnaires submitted by the active services providers through paper or e-mail.

Note

All legally lenders qualified to fulfill the related services - allowed or permitted entities, in terms of legal framing of the sector - are compelled to send to ICP-ANACOM the respective statistical information.

[Chapter III >](#)

INTRODUCTION | PEOPLE AND ICT

One of the most important dimensions when analysing the Information Society is the individual. If, on one hand, infrastructures are crucial, as they constitute the pillars of that society, on the other, its evaluation couldn't be possible without taking into account the way agents acknowledge and make use of the available tools and technologies.

The main source of the information provided in this chapter is the Survey on ICT Usage in Households and by Individuals. It is carried out since 2002 by the Portuguese National Statistical Institute (INE) in cooperation with the UMIC - Knowledge Society Agency.

The main conclusions are:

- The availability of ICT in Portuguese households has generally increased. The computer access, in particular, has grown 18% between 2002 and 2006;
- In 2006, the international comparison of computer access shows that Portugal is in the middle range of European countries (45%) - EU25 average of 62%;
- From 2003 to 2006, Internet connection through analogue modem or ISDN has decreased among the Portuguese households (70% in 2003; 29% in 2006);
- Internet access through broadband has largely increased: in 2003, 8% of the households had this type of connection; in 2006, it reaches nearly a quarter of the households;
- The regions of Lisboa and Centro have the highest level of ICT usage: respectively, 51% and 44% of the individuals use computer and 45% and 37% access the Internet;
- In 2006, Portugal is the European country with the lowest percentage of computer usage (42%) - EU25 average of 61%;

INTRODUCTION | PEOPLE AND ICT

- Internet usage has increased from 19% in 2002 to 36% in 2006;
- The most common way of obtaining e-skills is through self-study in the sense of learning by doing, stated by 39% of individuals in 2005 and 42% in 2006;
- The practice of e-commerce in Portugal is scarce compared with the European average: in 2006, 5% of the Portuguese citizens have ordered over the Internet against 21% of EU25.

METHODOLOGICAL NOTES | PEOPLE AND ICT

The **Survey on ICT Usage in Households and by Individuals** is in the framework of the development of Information Society statistics, is carried out in an annual basis and follows the Eurostat's methodological guidelines.

Scope

Households with at least one individual aged between 16 and 74 years old, living in dwellings of main residence and individuals aged 16 to 74 years old.

Sample

- 2006:** 5 941 dwellings of main residence, resulting in 4 038 households with at least one individual aged between 16 and 74 years old and 9 045 individuals within that age group were inquired
- 2005:** 6 026 dwellings of main residence, resulting in 4 298 households with at least one individual aged between 16 and 74 years old and 9 716 individuals within that age group were inquired
- 2004:** 6 026 dwellings of main residence, resulting in 4 432 households with at least one individual aged between 16 and 74 years old and 10 023 individuals within that age group were inquired
- 2003:** 6 026 dwellings of main residence, resulting in 4 564 households with at least one individual aged between 16 and 74 years old and 9 990 individuals within that age group were inquired
- 2002:** ad-hoc module within the Labour Force Survey for which 20 000 dwellings of main residence were selected. For the ICT Survey, 14 175 households with at least one individual aged between 16 and 74 years old and 17 857 individuals within that age group were inquired

METHODOLOGICAL NOTES | PEOPLE AND ICT

Reference period:

2006:	first quarter 2006
2005:	first quarter 2005
2004:	first quarter 2004
2003:	March, April and May 2003
2002:	second quarter 2002

Survey Method

Face-to-face interview with portable computer.

Data collection

2006:	April and May 2006
2005:	April and May 2005
2004:	May and June 2004
2003:	June 2003
2002:	July to October 2002

Note

In some tables, not considering multi responses tables, due to unit percentages rounding, total may differ from 100%.

METHODOLOGICAL NOTES

Chapter IV >

INTRODUCTION | eGOVERNMENT

Public Administration has, in many cases, constituted itself as an engine of development and a promoter of best practices in what Information Society is concerned. Therefore, the accompaniment and understanding of ICT usage by the Public Administration Bodies is decisive, being a key area to monitor.

In this chapter, you will find a variety of statistical information regarding some of the main Public Administration sub-sectors, such as: Central Public Administration, Regional Public Administration (Açores and Madeira) and City Councils.

Central Public Administration

The first subchapter concerns the results, from 2000 to 2006, of the Survey on Information and Communication Technologies Usage in Central Public Administration carried out by the UMIC - Knowledge Society Agency.

The main findings are:

- All Central Public Administration Bodies are connected to the Internet;
- In 2006, similarly to previous years, Internet is more frequently used for information and communication purposes and less for R&D activities;
- 77% of Central Public Administration Bodies have an Internet connection speed superior or equal to 512 Kbps, representing an annual average growth rate of 22% since 2003;
- Approximately 9 in 10 Central Public Administration Bodies have Internet presence (88%);
- The most commonly available website services, excluding e-mail (97%), are those of an informational nature: institutional information about the Central Public Administration Body (98%), information about the services provided (94%) and legislation (89%);
- 27% of Central Public Administration Bodies place orders over the Internet.

INTRODUCTION | eGOVERNMENT

Regional Public Administration

The second subchapter presents the results, from 2003 to 2005, of the Survey on Information and Communication Technologies Usage in Regional Public Administration (Açores and Madeira) performed by the UMIC - Knowledge Society Agency.

The main findings are:

- All Regional Public Administration Bodies are connected to the Internet;
- 63% of the Autonomous Region of Madeira Public Bodies and 46% of the Autonomous Region of Azores Public Bodies have an Internet connection speed superior or equal to 512 Kbps, which is equivalent to an annual average growth rate of, respectively, 34% and 28% since 2003;
- 86% of the Autonomous Region of Madeira Public Bodies and 77% of the ones which belong to the Autonomous Region of Azores have Internet presence;
- Ordering over the Internet is a method used by 10% of the Autonomous Region of Madeira Public Bodies and 21% of the Autonomous Region of Açores Public Bodies.

INTRODUCTION | eGOVERNMENT

City Councils

The final subchapter presents the results, from 2003 to 2006, of the Survey on Information and Communication Technologies Usage in City Councils carried out by the UMIC - Knowledge Society Agency.

The main findings are:

- All City Councils are connected to the Internet;
- Internet is mainly used for information and communication purposes: finding and gathering information/documentation (99%), email (98%) and electronic exchange of files (96%);
- 93% of City Councils have an Internet connection speed superior or equal to 512 Kbps, corresponding to an annual average growth rate of 44% since 2003;
- 96% of City Councils have Internet presence;
- Regarding the website services provided, e-mail still prevails the most usual (78%). Though, it should be pointed out that 74% of City Councils with Internet presence already allow the possibility to download and print forms;
- 16% of City Councils place orders over the Internet, generally acquiring computer consumables.

METHODOLOGICAL NOTES

INTRODUCTION | EDUCATION AND ICT TRAINING

In the development of Information Society, promoting equality of ICT access and the appropriate skills for its use are crucial factors, assuming the educational sphere a determinant role in the changing process. In this sense, accompanying and monitoring the adaptation of the educational system to the demands of ICT are of extreme importance.

In this chapter, you will find statistical data regarding ICT diffusion in primary and secondary schools, as well as information about supply and demand of ICT training in higher education.

ICT in Schools

The information presented in the first subchapter, of the Bureau for Information and Evaluation of the Education System (GIASE) responsibility, refers to the number of enrolled students in the regular teaching, the number of computers and the number of computers connected to the internet in primary and secondary schools.

The main findings are:

- The data reveals the doubling of the number of computers connected to the internet in the education and teaching institutions between 2001/2002 and 2005/2006;
- In that period there is an increasing on the percentage of computers connected to the Internet in public establishments. In 2005/2006, about 3 in each 4 computers were connected to the Internet;
- Between 2001/2002 and 2005/2006, the ratio students per computer connected to the Internet went from 33,8 to 14,0. In the public facilities, the ratio went from 38,9 to 15,7.

INTRODUCTION | EDUCATION AND ICT TRAINING

ICT Training in Higher Education

The last subchapter presents statistical information on ICT training in higher education, produced by the Observatory for Science and Higher Education (OCES), namely regarding the creation of ICT courses, numerus clausus, number of new entrants (1st time) and number of graduates.

The main findings are:

- Between the 1997/1998 and 2004/2005 school years, the number of ICT courses in Higher Education applying to public higher education grew at an annual average rate of 8,02%, while non public higher education registered an annual average growth of 1,57%;
- Between the 1997/1998 and 2004/2005 school years, there was a positive growth of the total of numerus clausus in ICT in public higher education (AAGR of 4,97%). However the total of numerus clausus in ICT presents a negative annual average growth (-0,35%);
- From 1997/1998 to 2004/2005, the number of new entrants (1st year, 1st time) in ICT courses increased in public higher education (AAGR of 2,88%) and decreased in non public higher education (AAGR of -6,54%), which corresponded to a global average growth of 1,22% per year;
- During this period, the proportion of women enrolled in ICT (1st year, 1st time) was lower than that of men. This difference has been rising with the increase in the percentage of men enrolled in ICT 1st year, 1st time (on average 0,78%) and the decrease in the percentage of women (AAGR of -3,68%);

INTRODUCTION | EDUCATION AND ICT TRAINING

- Between the 1997/1998 and 2003/2004 school years, the annual average growth of the number of ICT graduates was positive (AAGR of 6,65%). This growth was mainly due to the performance of public higher education (AAGR of 9,05%);
- The proportion of women graduates in ICT has always been lower than that of men during this period. This difference has still increased between 1997/1998 and 2003/2004, mostly as a result of the slowdown in the annual growth rate of women graduates in ICT (AAGR of -5,13%).

2. ICT TRAINING IN HIGHER EDUCATION

2.1 Creation of ICT Courses in Higher Education

Table IV.5 Trends in the total number of pairs educational institution/initial training course and of pairs educational institution/ICT course

1997/1998-2004/2005, Number of pairs educational institution/initial training course/Number of pairs educational institution/ICT course

	1997/1998	1998/1999	1999/2000	2000/2001	2001/2002	2002/2003	2003/2004	2004/2005
Total number of pairs educational institution/initial training	1 404	1 494	1 541	1 585	1 633	1 673	1 696	1 745
Number of pairs educational institution/ICT course	119	137	140	153	157	157	163	173

Note: The pairs educational institution/course corresponds to the number of courses in higher education for which numerus clausus in the 1997-2004 school years were agreed.
Source: OCES / MCTES.

Table IV.6 Trends in the number of pairs educational institution/ICT course, by type of educational institution

1997/1998-2004/2005, Number of pairs educational institution/ICT course

	1997/1998	1998/1999	1999/2000	2000/2001	2001/2002	2002/2003	2003/2004	2004/2005
Public	67	75	79	91	95	105	110	115
Non public	52	62	61	62	62	52	53	58
Total	119	137	140	153	157	157	163	173

Notes:

- 1) The pairs educational institution/course corresponds to the number of courses in higher education for which numerus clausus in the 1997-2004 school years were agreed;
- 2) The pairs educational institution/course corresponds to the application procedures at national, local and institutional levels;
- 3) Non-public education includes the private and cooperative education and Portuguese Catholic University.

METHODOLOGICAL NOTES | EDUCATION AND ICT TRAINING

1. ICT IN SCHOOLS

The statistical data collected was obtained from surveys, models 400 and 700 registered in INE, directed to all state and private education and teaching institutions (ETI), during the school years of 2001/2002, 2004/2005 and 2005/2006.

Electronic formularies were conceived from the quoted notation instruments, which allowed a significant increase in the quality of the data made available by each ETI. Emphasize the fact that all the state ETI made use of the electronic format to answer the notation instruments used by GIASE.

The data made available in this chapter refers to the number of students in the regular teaching, the number of computers and the number of computers connected to the internet in the Primary School and the Secondary School.

2. ICT TRAINING IN HIGHER EDUCATION

Statistical data regarding the supply and demand of ICT courses (courses offering training in Information and Communication Technologies) in Higher Education, between 1997/1998 and 2004/2005.

Variables

Pairs educational institution / course

The pair educational institution/ course corresponds to the number of courses in higher education for which numerus clausus in the 1997/1998 and 2004/2005 school years were agreed

METHODOLOGICAL NOTES | EDUCATION AND ICT TRAINING

Numerus Clausus

Numerus Clausus corresponds to the number of places set for the application procedures to higher education, at national, local and institutional levels, between 1997/1998 and 2004/2005. These refer to initial training courses: tertiary education – first degree; starting programme to second degree university level; second degree university level (in two phases) and second degree university level.

New entrants (1st year 1st time)

The new entrants (1st year 1st time) refer to students enrolled in the following courses:

- tertiary education – first degree;
- second degree university level (in two phases – 1st cycle);
- starting programme to second degree university level;
- second degree university level;
- complementary training for the attainment of a second degree university level addressed to early childhood, primary, lower secondary and secondary education teachers;
- qualification for early childhood, primary, lower secondary education and secondary education teachers to perform other educational activities;
- complementary training for nurses;
- higher education specialised studies (already extinct).

The data presented refer to the period between the 1997/1998 and 2004/2005 school years and result from the students' annual statistical survey.

Only the new entrants (1st year 1st time 1st cycle) in second degree university level (in two phases) courses were included.

METHODOLOGICAL NOTES | EDUCATION AND ICT TRAINING

Enrolled Students

Enrolled students correspond to the number of students enrolled in the courses mentioned in the previous item (2.3.).

The data presented refer to the period between the 1997/1998 and 2004/2005 school years and result from the students' annual statistical survey.

Graduates

The data concerning graduates refer to the following degrees and diplomas:

- Graduation degree “Bacharel” (first university degree);
- Graduation degree “Licenciado” (second university degree);
- Higher education specialised studies diploma (already extinct).

The data presented refer to the period between the 1997/1998 and 2003/2004 school years and result from the students' annual statistical survey.

Data collection for Variables Pairs educational institution / course and Numerus Clausus Administrative data (of a census nature) collected by OCES' (Observatory of Science and Higher Education) Department of Higher Education Statistics (DSEI), based on the global volume of training supply in Information and Communication Technologies (ICT).

Methodological procedures

The scientific fields was used from International Standard Classification of Education (ISCED) 1997, as defined by the National Classification of Fields of Training (legally approved by Portaria n.º 316/2001, of 2nd April), hereafter specified in the following table.

From this categorisation, courses with a sound ICT training component were chosen based on curricular plans. It was created a new field (ICT field) which gathers several courses from the different groups that integrate the National Classification of Fields of Training.

METHODOLOGICAL NOTES

[Chapter VI >](#)

INTRODUCTION | ICT IN HOSPITALS

The analysis of the health sector as dimension of the Information Society is justified by the importance of the sector both for social and economic matters. The closer the health care is to consumers the more effective it is – the information and communication technologies (ICT) as well as its mechanisms may and should stimulate that relation.

The analytical tool for the analysis of ICT diffusion in the health sector, namely in hospitals, and source of this chapter, is the Survey on ICT Usage in Hospitals. It was conducted in 2004 and 2006 under joint responsibility of the Portuguese National Statistical Institute (INE) and the UMIC - Knowledge Society Agency.

These are the main conclusions:

- Accessing to the Internet is possible for almost all hospitals, mainly by a connection through broadband;
- Around 17% of the hospitals with Internet access have computers connected to the web for inpatients;
- Telediagnosis and teleappointment are the main activities within the telemedicine since 2004;
- The proportion of hospitals with presence in the Internet increased from 40% to 58%, between 2004 and 2006;
- The presence in the Internet through a webpage in a health portal or in the Ministry of Health website tends to increase;

INTRODUCTION | ICT IN HOSPITALS

- The majority of hospitals without presence in the Internet stated that the website is in implementation (65% in 2006);
- 34% of the hospitals have ordered over the Internet in 2005;
- From the hospitals that have ordered over the Internet, around 32% made online payments.

METHODOLOGICAL NOTES | ICT IN HOSPITALS

The **Survey on ICT Usage in Hospitals** is in the framework of the development of the **Information Society** statistics and was conducted twice: the first time in 2004 and the second in 2006.

Scope

Hospitals in activity within the Official (Public and Non-Public Hospitals) and Particular Sectors in Portugal.

Frame population

For both editions of this survey a census was conducted.

2006: 198 hospitals

2004: 203 hospitals

Reference period

30th June of the reference year.

Survey method

Self-administered mail survey.

Data collection

2006: June to October 2006

2004: August to October 2004

Note

In some tables, not considering multi responses tables, due to unit percentages rounding, total may differ from 100%.

METHODOLOGICAL NOTES

INTRODUCTION | DIGITAL ECONOMY

Enterprises have a crucial role in Information Society development. On the one hand, the access and usage of information and communication technologies works as an important catalyser of this area. On the other hand, the introduction of ICT in enterprises may correspond to significant profits, in what concerns to its increasing competitiveness in economic context.

This chapter presents statistic information about enterprises, enterprises of financial sector and micro enterprises.

Enterprises

The first subchapter concerns the results, from 2003 to 2005, based in the Survey on Information and Communication Technologies Usage in Enterprises, developed by Portuguese National Statistical Institute (INE) in cooperation with the UMIC - Knowledge Society Agency.

The main findings are:

- 81% of enterprises use Internet ;
- Broadband is the most usual type of internet connection in enterprises (63%), which represents an Average Tax of Annual Growth of 43% comparing with 2003;
- Approximately 4 in each 10 enterprises have website presence;
- 26% of enterprises use Internet or other electronic network for ordering and/or receiving orders of products and/or services.

Enterprises – Financial Sector

The second subchapter concerns the results, from 2003 to 2005, based in the Survey on Information and Communication Technologies Usage in Enterprises of NACE Section J, developed by Portuguese National Statistical Institute (INE) in cooperation with the UMIC - Knowledge Society Agency.

INTRODUCTION | DIGITAL ECONOMY

The main findings are;

- All enterprises of financial sector use Internet;
- Broadband is the most usual type of Internet connection (89%);
- Approximately 9 in each 10 enterprises of financial sector use Internet for interaction with public bodies;
- Almost half of enterprises of financial sector use the Internet for interaction with costumers (49%).

Micro Enterprises

The last subchapter concerns the results, from 2003 to 2005, based in the Survey on Information and Communication Technologies Usage in Enterprises, developed by Portuguese National Statistical Institute (INE) in cooperation with the UMIC - Knowledge Society Agency.

The main findings are:

- Approximately 4 in each 10 micro enterprises use Internet (49%);
- Broadband connection type is used by 26% of micro enterprises;
- Internet for interaction with public bodies is used by 21% of micro enterprises;
- 8% of micro enterprises use Internet or other electronic network for ordering and/or receiving orders of products and/or services.

METHODOLOGICAL NOTES | DIGITAL ECONOMY

1. ENTERPRISES

The **Survey on ICT Usage in Enterprises** is in the framework of the development of **Information Society** statistics, is carried out in an annual basis and follows the Eurostat's methodological guidelines.

Scope

Enterprises in Portugal with 10 or more persons employed.

Scope of economic activity

NACE Sections:

D	Manufacturing
F	Construction
G	Wholesale and retail trade; repair of motor vehicles, motorcycles and personal and household goods
H	Hotels and restaurants (only groups 551 and 552)
I	Transport, storage and communication
K	Real estate, renting and business activities
O	Other community, social and personal service activities (only groups 921 and 922)

Sample

2005:	2 075 enterprises
2004:	2 809 enterprises
2003:	3 107 enterprises

METHODOLOGICAL NOTES | DIGITAL ECONOMY

Reference period:

2004 and 2005:	January of reference year
2003:	Inquiry moment

Survey Method

2004 and 2005:	Self-administered mail and/or online survey
2003:	Self-administered mail survey

Data collection

2005:	May to September 2005
2004:	June to September 2004
2003:	July to October 2003

Note

In some tables, not considering multi responses tables, due to unit percentages rounding, total it's different from 100%.

METHODOLOGICAL NOTES | DIGITAL ECONOMY

2. ENTERPRISES– FINANCIAL SECTOR

The **Survey on ICT Usage in Financial Enterprises** is in the framework of the development of **Information Society statistics**, is carried out in an annual basis and follows the Eurostat's methodological guidelines.

Scope

Enterprises of financial sector (NACE Section J) in Portugal with 10 or more persons employed.

Scope of economic activity

NACE Section J – Financial activities

Sample

2005:	142 enterprises
2004:	142 enterprises
2003:	127 enterprises

Reference period

2004 and 2005:	January of reference year
2003:	Inquiry moment

Survey Method

2004 and 2005:	Self-administered mail and/or online survey
2003:	Self-administered mail survey

METHODOLOGICAL NOTES | DIGITAL ECONOMY

Data collection

2005: May to September 2005
2004: June to September 2004
2003: July to October 2003

Note

In some tables, not considering multi responses tables, due to unit percentages rounding, total may differ from 100%.

METHODOLOGICAL NOTES | DIGITAL ECONOMY

3. MICRO ENTERPRISES

The **Survey on ICT Usage in Enterprises** is in the framework of the development of **Information Society** statistics, is carried out in an annual basis and follows the Eurostat's methodological guidelines.

Scope

Enterprises in Portugal with less than 10 persons employed.

Scope of economic activity

NACE Sections:

D	Manufacturing
F	Construction
G	Wholesale and retail trade; repair of motor vehicles, motorcycles and personal and household goods
H	Hotels and restaurants (only groups 551 and 552)
I	Transport, storage and communication
J	Financial intermediation
K	Real estate, renting and business activities
O	Other community, social and personal service activities (only groups 921 and 922)

Sample

2005:	2 145 enterprises
2004:	1 782 enterprises
2003:	1 468 enterprises

METHODOLOGICAL NOTES | DIGITAL ECONOMY

Reference period

2004 and 2005:	January of reference year
2003:	Inquiry moment

Survey Method

2004 and 2005:	Self-administered mail and/or online survey
2003:	Self-administered mail survey

Data collection

2005:	May to September 2005
2004:	June to September 2004
2003:	July to October 2003

Note

In some tables, not considering multi responses tables, due to unit percentages rounding, total may differ from 100%.

GTAESI | Information Society Statistics Monitoring Working Group

By deliberation of the High Council of Statistics (nº 174), in plenary session on 8th July of 1999, was approved the implementation of an Official Statistics for the Information Society area. In the context of this deliberation was also decided to create the Information Society Statistics Monitoring Working Group.

The mandate of this group was defined according to the following terms:

- a) The coordination, integration and methodological harmonization of statistical information collected by the different organizations, in the scope of Information Society, and eventually the presentation of proposals for new survey inquiries creation;
- b) The conceptual and methodological reflection on the production of indicators for the Information Society;
- c) The presentation of proposals for statistical indicators production which allow to express the levels of economic-social impact and of the Information Society penetration development in the Portuguese society; being, in order to achieve this purpose, necessary to revise and/or incorporate methodologies that stress the country specificities;
- d) The articulation with several representations of Portugal in international organizations, namely, OECD and EUROSTAT.

GTAESI | Information Society Statistics Monitoring Working Group

The current composition of the working group is the following:

- **UMIC - Knowledge Society Agency**
Public agency operating within the Portuguese Ministry of Science, Technology and Higher Education with the mission of planning, coordination and projects development in the areas of the Information Society, including those of electronic government.
