Organization: Kosovo Agency of Statistics

Abstract

The structural business survey is carried out in order to obtain indicators of enterprise activity structure and outcomes of their business.

This paper treats some details of the first data analysis of the Structural Business Statistics (SBS), concerning the frame error non-response rates and post-stratification as well as the analysis made in order to check and edit data for KAS. The analysis is done on the 'raw' data with higher overview on the frame error, editing, post-stratification, non-response analysis and the small overview on some findings on estimated numbers of enterprises, entrepreneurs and employees in Kosovo.
